

Relaticle App Summary

What it is

Relaticle is a next-generation open-source CRM platform built on Laravel, aimed at teams that want a modern, self-hosted CRM without SaaS lock-in.

Who it is for

Laravel developers, agencies, and SMBs who need a customizable, self-hosted CRM.

What it does

- Manage contacts, companies, and opportunities in a modern interface.
- Create and manage no-code custom fields.
- Support multiple teams with isolated workspaces.
- Self-host for full data ownership and privacy.
- Built on Laravel 12 with Filament 4 and Livewire 3 UI.
- Open-source under the AGPL-3.0 license.

How it works

- Browser UI rendered via Filament 4 and Livewire 3 inside a Laravel 12 app (app/, app-modules/).
- Authentication scaffolding uses Laravel Jetstream; API token auth uses Laravel Sanctum (composer.json).
- Data persisted in a relational database; README lists PostgreSQL 15+, while docker-compose.yml provides MySQL for Sail dev.
- Background jobs handled by Laravel queues with Horizon; Redis is listed in README and docker-compose.yml.
- Optional services in docker-compose.yml: Meilisearch for search, Mailpit for local email, Selenium for browser testing; frontend assets built with Vite and Tailwind (package.json).

How to run

1. Install requirements: PHP 8.4+, Composer 2, Node.js 20+, PostgreSQL 15+; Redis optional (README).
2. Clone and install: git clone <https://github.com/Relaticle/relaticle.git>, cd relaticle, composer app-install.
3. Start dev services: composer dev (runs server, queue, logs, and Vite).
